

Inclusion of students with disabilities in Brazilian tertiary Education

Kaizô Iwakami Beltrão ^a 
Moema de Poli Teixeira ^b 
Hugo Segrilo Simas ^c 

Abstract

In 2016, Brazil approved Law n° 13,409, determining quotas for individuals with disabilities in post-secondary non-tertiary and tertiary education courses of federal educational institutions. Since 1995, National Institute for Educational Studies and Surveys/Ministry of Education (Inep/MEC) has collected data on university courses and student enrollment with the Higher Education Census. Since 2009, this census lists and individually identifies with a code generated by Inep all students enrolled in Higher Education courses, with various information, including whether they have or not any disabilities. Few studies on students with disabilities in tertiary education have been conducted exploring this extensive database. The current study outlines a profile of students with disabilities who joined the system from 2009 to 2019, last year when it was possible to obtain the information. Due to the Brazilian General Data Protection Law, Inep discontinued the publication of microdata per student, which allowed the tabulations presented here. Not only was this done, but the microdata used in this text was also removed from the page. The students with disability showed a different profile when compared to other students; for example, with respect to the distribution by gender, age and choice of course/area. Obviously, institutions that offer some type of assistive technology and/or technical help seem to attract more students with disability. The largest number of students with disability present physical disabilities, followed by vision-impairment, both increasing in time. The total contingent of students with disability more than doubled in the period under

scrutiny, with an average growth rate of 9.0% p.y., but percentage of students with disability in Higher Education is still smaller when compared to the total number of students. The growth trend shows that the inclusion process in tertiary education is still beginning.

Keywords: Higher Education. Statistical Data. People with Disabilities. Inclusive Education.

1 Introduction

Persons with disabilities have rarely been the subject of academic research in the past. Students with disabilities, however, have been a matter of concern in recent decades, in several countries, including Brazil, in the midst of discussions about expansion of Access in to Higher Education for specific segments of the population. In particular, the Sustainable Development Goals (SDG) mention Education for people with disabilities in four of the goals (UNITED NATIONS, 2015). There has been unequivocal progress in expanding Access in to Education, at all levels of Education, for people with disabilities, along with other social groups that suffer discrimination and prejudice, including in school settings. This progress has been achieved through a set of government policies and private actions conducted by international forums. However, to be really effective, these inclusion policies need studies and reliable statistics to understand individual needs and to ensure that people with disabilities are as successful as possible in their academic career. There is a substantial amount of work carried out in the Education of children with disabilities (BALESCUT; EKLINDH, 2006; EVANS, 1995; HAYES; BULAT, 2017; OECD, 1999; PETERS, 2003; UNESCO, 2015), but there is still a proportionally smaller amount of studies that address Higher Education, even at an international level, possibly because government policies were originally aimed at basic Education and because people with disabilities still arrive in very small numbers so far along their educational path. The first works date from the late 1980s and reflect individual concerns (HURST, 1998; VAN ACKER, 1998) or those of international organizations (EBERSOLD, 2008; OECD, 1999).

Considering the relevance of inclusion of students with disabilities in the agenda of educational policies, especially in areas where inclusion is still deficient, data from Higher Education censuses (Inep/MEC¹) are analyzed to raise the profile of students with disabilities and to verify whether policies have, in fact, managed

¹Instituto Nacional de Estudos e Pesquisas Educacionais/Ministério da Educação – National Institute for Educational Studies and Surveys/Ministry of Education.

to have some effect on the contingent of students with disabilities in Higher Education over a period of 10 years (2009 to 2019). Disability information has been collected in the Census since 2009, from when it is possible to identify students individually and follow them in the different calendar years. In order to study the impact of the internal policies of Higher Education institutions, this study considered information on Access inibility to infrastructure and programs aimed at this group, data also available in the Census.

2 International principles: Conventions and agreements

The path to the inclusion of people with disabilities in the various countries is marked by important general principles established at world conventions and conferences over the past 30 years. This theoretical, methodological, conceptual, and political framework is closely linked to the history of people with disabilities's movements in the struggle for their civil rights around the world and in the establishment of a positive social identity as opposed to the model brought by medical science, which is marked by a view of deficiencies characterized as disease or health problem and linked to the notion of tragedy, religious charity and negativity (MARTIN, 2012).

The first major milestone concerning Education was established at the World Conference on Education for All in Jomtien, Thailand, in March 1990 (UNICEF, 1990). Inspired by the UN Universal Declaration of Human Rights of 1948 – specifically on the right of all to Education, it is committed to socially excluded or discriminated groups, including those with “the basic learning needs of the disabled²” (UNICEF, 1990).

A few years later, in 1994, the World Conference on Special Needs Education (UNESCO, 1994), the second landmark in Salamanca, which, in its preamble, called upon governments “to endorse the approach of inclusive schooling and to support the development of special need Education as an integral part of all educational programmes”. The so-called “The Salamanca Statement and Framework for Action” places “special needs Education” on another level, consolidating a change of this area point-of-view in the direction of “inclusive Education”.

The Inter-American Convention for the Elimination of All Forms of Discrimination against Persons with Disabilities, known as the Guatemalan Convention (OAS, 1999), expresses on article II the objective of “preventing and eliminating all forms of discrimination against persons with disabilities and providing

²The terminology recommended nowadays is *person with disability*.

their full integration into society”, committing itself to various measures to achieve this goal.

Soon after, the reconceptualization of disability, contained in the new international classification, adopted in 2001 by the World Health Organization (WHO), played another important role. By conceptualizing deficiency in terms of the interaction between an individual, the limitations and possibilities imposed by his disability and the forms of support offered by the “environment”, the WHO made disability a universal issue (EBERSOLD, 2008).

Thus, the International Classification of Functioning, Disability and Health (ICF) defines deficiency in a comprehensive way, considering the limitations of activities and restrictions of participation of the individual in society. Disability began to be understood from the negative aspects of interaction between individuals with a health condition (e.g., cerebral palsy, Down syndrome and depression) linked to personal and environmental factors (such as negative attitudes, inaccessible transportation, difficulty in accessing public buildings and limited social support) (WHO, 2018).

In 2004, Montreal hosted the Pan-American Health Organization (Paho) and WHO Conference on Intellectual Disability (LECOMPT; MERCIER, 2007), whose focus was on the rights of people with this specific type of disability (OPAS/OMS, 2004).

In commemoration of the 58th anniversary of the Universal Declaration of Human Rights, the UN General Assembly on 13 December 2006 endorsed the United Nations Convention on the Rights of Persons with Disabilities (UN, 2006), which entered into force in 2008, after at least 20 ratifications, with the purpose “to promote, protect and ensure the full and equal enjoyment of all human rights and fundamental freedoms by all persons with disabilities, and to promote respect for their inherent dignity” (Article 1). In 2009, Decree n° 6,949 promulgated the Convention, signed by the Brazilian government in New York, on March 30, 2007.

Currently, the United Nations (UNITED NATIONS, s.d.) website provides links which disseminate the laws of each country in favor of the rights of people with disabilities, with emphasis on the fact that the laws contribute to implement the Convention on the Rights of Persons with Disabilities and to achieve the SDG.

The 2030 agenda for SDG provides a shared plan for peace and prosperity for all people and the entire planet. In 17 objectives of the original UN document, people with disabilities are named in objectives 4 (regarding quality Education) and 10 (reduced inequalities).

Specifically in Brazil, people with disabilities are mentioned in five of the 17 objectives: objectives 4 (quality Education), 8 (decent work and economic growth), 10 (reduced inequalities), 11 (sustainable cities and communities) and 17 (partnerships for the goals).

3 Brazilian legal framework

A bibliography concerning the Brazilian legislation on people with disabilities can be found in Beltrão (2022a). Historically, individuals identified with “special needs”, “exceptionalities” and all others euphemistic terms used in the past to characterize people with disabilities in their most different modalities, were educated outside school or treated differently through a specialized or “Special Education”, which led to the creation of specific institutions for this purpose, substituting the regular ones. It dates from 1854 the creation of the Institute of Blind Boys (now the Benjamin Constant Institute), and from 1856, that of the Institute of the Deaf Dumb (now called the National Institute of Deaf Education), in Imperial Rio de Janeiro.

Already at the beginning of the Republic, in 1926, the Pestalozzi Institute was founded, aimed at the care of people with mental disabilities. The Association of Parents and Friends of The Exceptional was created in 1954, and in 1961, the first Law of Guidelines and Bases of National Education (known as LDB) n° 4,024/61 (BRASIL, 1961), established the right of these people with disabilities to Education, preferably within the general Education system.

After the military government, there was a kind of retreat towards an inclusive educational policy with Law n° 5,692/71 (BRASIL, 1971), which, among the changes it implemented in the law of 1961, again established special treatment for students with physical and mental disabilities, reinforcing the role of special classes and schools. In 1973, the National Center for Special Education was created, being responsible for the management and guidance of the Education of students with disabilities, part of the Ministry of Education (MEC) structure, whose actions were marked by a state welfare service unit. However, some authors acknowledge that during the dictatorial regime, specialized special Education institutions received incentives that enabled their dissemination throughout

the national territory, as well as increased their influence over national special Education policies (BUENO, LEHMKHUL; GOES, 2019).

In 1996, a new law of guidelines and bases for national Education, LDB (BRASIL, 1996), was enacted, Law nº 9,394, which in item III of article 4 assures the guarantee of “free specialized educational assistance to students with special needs, preferably in the regular school network”. The new LDB dedicates, for the first time, a specific chapter to Special Education in three articles: 58th, 59th and 60th. Article 58 defines special Education as “the modality of school Education, preferably offered in the regular Education network, for students with special needs”, providing in its first paragraph that, if necessary, the regular school should offer specialized support services to meet the needs characteristics of this clientele. The second paragraph, however, admits the possibility that the educational service is provided in classes, schools or specialized services depending on the specific conditions of the students and whenever it is impossible to integrate it into the common classes of regular Education. The third paragraph establishes that the provision of special Education is a constitutional duty of the State, which must begin in the age group from zero to six years. More recently, Law nº 13,632 (BRASIL, 2018) rewords this paragraph, extending the right to special Education “throughout life”. Article 59 deals with teaching-learning processes, establishing that curricula, methods, techniques and other educational resources must meet the special needs of these students, as well as demonstrating concern with the completion of fundamental Education, with the adequate training of teachers, with special Education for the work and with the Access in of these students to the available supplementary social programs. Article 60 reinforces that “the public power will adopt, as a preferential alternative, the expansion of the attendance of students with special needs in the regular public Education network”.

The social inclusion policy of people with disabilities was only guaranteed by the 1988 Constitution (BRASIL, 2019) that, in articles 205, 206, 207, 208, 209, 211 and 227, dealt with general principles of the right of all to Education.

But it was with the promulgation of Law nº 7,853 of 1989 (BRASIL, 1989), later regulated by Decree nº 3,298 of 1999 (BRASIL, 1999), that support for the integration of people with disabilities received, for the first time, a specific treatment. The next step of legal support came from Law nº 8,213 (BRASIL, 1991) which, by providing for Social Security Benefit Plans, in its art. 93, determined the first quota law for people with disabilities in the labor sphere, aimed at companies with more than 100 employees. Also in 1999, Ordinance nº 1,679 (BRASIL, 1999) of the MEC, later replaced by Ordinance nº 3,284 of

2003 (MEC, 2003), established the Access inibility requirements of people with disability for accreditation, authorization and recognition of Higher Education courses in the country.

Laws nº 10,048 (BRASIL, 2000a) and nº 10,098 (BRASIL, 2000b), both regulated by Decree nº 5,296 of 2004 (BRASIL, 2004): the former giving priority to the elderly, pregnant women, lactating women, children with disabilities in public transport and offices; and the latter, by establishing general norms and criteria for promoting Access inibility for people with disability or with reduced mobility.

Law nº 10,257 (BRASIL, 2001), known as the City Statute, regulated Articles 182 and 183 of the Constitution, establishing the guidelines of urban policy.

In 2002, Law nº 10,436 (BRASIL, 2002) regulated the Brazilian Sign Language (known as Libras³), and Ordinance nº 2,678 of the MEC approved Braille spelling for the Portuguese language, recommending its use throughout the national territory. In 2005, Decree nº 5,626 (BRASIL, 2005a) regulated Law nº 10,436 (BRASIL, 2002) and Article 18 of Law nº 10,098 (BRASIL, 2000b).

In 2003, the Federal Prosecutor published a Manual of Inclusive Education, entitled: “Access in of students with disabilities to schools and common classes of the regular network” (BRASIL, 2003).

Law nº 11,096 (BRASIL, 2005b), which created Prouni⁴ – University for All Program – specifically included the “student with disabilities” as target of this scholarship program to expand the Access in to this level of Education.

The Normative Ordinance nº 14 (MEC, 2007) of the MEC instituted the Program “*Incluir*” (Inclusion): Access inibility in Higher Education, with a view to implementing Decree nº 5,296/2004 (BRASIL, 2004), which established general standards and basic criteria for promoting Access inibility to people with disability or people with reduced mobility, and Decree nº 5,626/2005 (BRASIL, 2005a), which provided for the use and dissemination of the Libras and established that educational systems should ensure the inclusion of Libras Education in all teacher training courses.

³Linguagem Brasileira de Sinais.

⁴Programa Universidade para Todos.

The following year, Secadi⁵ – Secretariat of Continuing Education, Literacy, Diversity and Inclusion – MEC, instituted the National Policy of Special Education in the Perspective of Inclusive Education.

Decree nº 7,234 (BRASIL, 2010), provided for the National Program of Student Assistance (Pnaes⁶), aiming to expand the conditions of permanence of young people in federal public Higher Education, working for public Higher Education as Prouni worked for private Education.

In 2011, two decrees were issued favoring people with disabilities: nº 7,611 (BRASIL, 2011a), on special Education and specialized educational care, and nº 7,612 BRASIL, 2011b), which instituted the National Plan for the Rights of Persons with Disabilities or the Plan living without limit.

In 2012, three more laws of interest to the population with disabilities were sanctioned: Law nº 12,587 (BRASIL, 2012a), which instituted the guidelines of the National Urban Mobility Policy; Law nº 12,711 (BRASIL, 2012b), which dealt with admission to federal universities and federal post-secondary non-tertiary technical Education institutions, known as the Quota Law, which, in 2016, was amended by Law nº 13,409 (BRASIL, 2016) to include admission quotas for people with disabilities; and Law nº 12,764 (BRASIL, 2012c), which instituted the National Policy for the Protection of the Rights of People with Autism Spectrum Disorder.

Secadi/Sesu/MEC launched in 2013 a guide document of the Program “*Incluir*”: Access inibility in Higher Education, aimed at guiding the institutionalization of Access inibility policy in federal institutions of Higher Education – Ifes.

In 2015, Law nº 13,146 (BRASIL, 2015) or Statute of Persons with Disabilities, the Brazilian Law for the Inclusion of People with Disabilities, was sanctioned. Among other impacts on the lives of people with disabilities, this Law had the role of revoking Articles 3 and 4 of the Brazilian Civil Code, which included among those unable to personally perform acts of civil life people with mental disabilities. Also in that year, the Brazilian Association of Technical Standards - ABNT⁷ NBR 9050 (3rd edition) –, issued a technical standard on the adequacy of buildings, equipment and urban furniture to people with disabilities, a standard

⁵Secretaria de Educação Continuada, Alfabetização, Diversidade e Inclusão.

⁶Programa Nacional de Assistência Estudantil.

⁷Associação Brasileira de Normas Técnicas.

created in 1983, and which underwent two subsequent revisions, being updated in 1994 and 2004.

Reflecting the impacts that governments impose on the direction of public policies, on September 30, 2020, the Brazilian President signed a new Decree, nº 10,502 (BRASIL, 2020a), which instituted the National Policy of Special Education: Equitable, Inclusive and with Lifelong Learning. Considered a setback in the inclusive policies consolidated in the last 30 years in Brazil, by providing for the creation of classes and special Education schools, the decree was suspended by Supreme Court (STF⁸) Minister Dias Toffoli, on December 1, in response to Direct Action of Unconstitutionality (ADI⁹) nº 6,590 (STF, 2020), filed by the Brazilian Socialist Party (PSB). On December 21, 2020, the Plenary of the Supreme Court, after meeting to assess the merits of the action, maintained, by a majority of votes, the injunction that suspended the president's decree, understanding that it could "underpin public policies that weaken the imperative of the inclusion of students with disabilities, global developmental disorders and high skills or gifted in the regular school network" (STF, 2020, pp. 3-4).

4 Brazilian experience

In Brazil, as demonstrated in the previous section, legislation on inclusive policies in tertiary Education is recent. The difficulties of inclusion of students with disabilities in tertiary Education have been the target of research aimed at democratizing Access in and permanence of these students. Since 2003, by Ordinance nº 3,284 of the MEC (2003), universities have been evaluated in relation to the inclusive actions implemented, considering criteria for authorization and recognition of courses.

In a search on the theme of inclusion of students with disabilities in Brazilian Higher Education, conducted on the Internet between March 2017 and August 2022, on search sites as Scientific Electronic Library Online (SciELO), Google and Google Scholar through keywords as students with disability in Higher Education; inclusive Education in tertiary Education, 51 documents were selected, including articles, dissertations and academic theses. Similarly to the international panorama on the subject, Brazilian studies on Access inability in tertiary Education can be divided into two large groups (noting a significant increase in the number of empirical studies once the conceptual and legal bases were consolidated): those

⁸Supremo Tribunal Federal.

⁹Ação Direta de Inconstitucionalidade.

in which concepts and legislation are discussed and those in which qualitative and quantitative studies are presented concerning the people with disabilities inclusion in tertiary Education (BELTRÃO, K., 2022b). Studies of the first group, in general, present the advances in terms of legal guarantees to the rights of people with disabilities in all spheres of social life, while the second group of studies, in general, show how reality is far from the legal framework.

4.1 Disability in the census of tertiary Education in Brazil

Data on tertiary Education in the country have existed since 1908 with the publication in 1916 of the first Statistical Yearbook in Brazil, but the Census of Tertiary Education, itself, emerged only in 1997, together with Inep. In 2000, the Integrated System of Educational Information (SIED¹⁰) was created, comprising, among others, the information of the Census of Tertiary Education. On the same date, the first Census that collected information on the number of students “with special needs” took place. In 2007 the electronic system e-MEC became the official register of the accredited institutions of Higher Education and the courses authorized and recognized by MEC (INEP, 2020a). Data are collected through several modules. This work uses data from the Student Module, the Course Module and the Institution Module (INEP, 2020b).

Based on data from the Census of Tertiary Education, this text presents a time series analysis of the number of new admissions with disabilities per year and their characteristics, compared to those without disabilities¹¹, from 2009 to 2019, seeking to monitor the possible impacts of the legislation - first encouraging inclusion and Access inibility policies to the policy of quotas for people with disabilities - on the increase of people with disabilities in tertiary Education. It is important to emphasize that, in order to comply with the Brazilian General Data Protection Law, approved in 2019, Inep discontinued from 2020 on the publication of microdata per student, witch allowed the tabulations presented in this study. Therefore, the most recent available data refers to 2019, and the institution even removed the microdata used in this text from the page.

4.2 Database

To Access in the characteristics of the new admissions, we investigated the variables of students and institution/course available in the Census of Tertiary

¹⁰ *Sistema Integrado de Informações Educacionais.*

¹¹ The data presented are about the new admissions in the year of application of the Census of Higher Education. However, to maintain consistency with the other parts of the text, the term student will be used.

Education database, namely: type of disability (blind; vision impairment; deaf; hard of hearing; deaf-blind; physical; multiple or intellectual/mental), gender, age, enrollment situation at the end of the year (enrolled, graduating, leave of absence, transferred, dropout), admission by reservation of vacancies (quota), receiving scholarship/student financing, administrative category of the institution (public or private) and academic organization (*universidade, faculdade, centro universitário, instituto federal de educação e tecnologia*¹²) of the institution, tertiary Education degree (bachelor's degrees on Education, others bachelor's degrees, short-cycle tertiary Education), assistive technologies offered by the course. It is important to emphasize that the information related to the course and the IES (Higher Education Institutions) are provided by the institutions themselves and not by the students.

4.3 Evolution of young people with disabilities in Higher Education courses

The number of students entering in Higher Education grew from almost 2 million to more than 3.6 million between 2009 and 2019, but the number of students with disabilities, even though it has more than doubled in the same period, in percentage terms suffered a small oscillation, remaining at the level between 0.32% and 0.49% of the total number of students (see Table 1).

Table 1 - Students with and without disabilities in Higher Education (total and %) by year of admission – Brazil (2009–2019)

Disability	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019
without disability	1938766	2167033	2329421	2726491	2719094	3080209	2887388	2942695	3182759	3398944	3585986
with disability	7300	7382	7525	10150	10181	10349	11307	11755	13459	16861	17167
Total	1946066	2174415	2336946	2736641	2729275	3090558	2898695	2954450	3196218	3415805	3603153
% with disability	0.38	0.34	0.32	0.37	0.37	0.33	0.39	0.40	0.42	0.49	0.48

Source: Authors' own calculations with data from the Higher Education Census (INEP, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019)

¹² Higher Education institutions in Brazil are classified as *faculdades, centros universitários, universidades e institutos federais de educação e tecnologia* according to its operating characteristics. *Faculdades* are the basic classification and there are further conditions for the next levels. *Centros universitários* are multi-curricular Higher Education institutions covering one or more areas of knowledge, qualified faculty and proven academic working conditions. *Universidades* are characterized by the inseparability of teaching and research activities, institutionalized intellectual production relevant from a scientific and cultural, regional and national point of view, with least 1/3 of masters or doctors. *Institutos federais de educação e tecnologia* are concerned with basic and professional Education. In terms of regulation, evaluation and supervision of Higher Education institutions and courses, *institutos federais* are on a par with *universidades*.

The evolution of the new admissions, according to sex and disability (see Table 2), showed that, although the female contingent was higher in relation to the number of male students, for the student body as a whole, among those with disabilities, the male contingent was higher, exception only in 2009.

Table 2 - Students with and without disabilities in Higher Education by sex, according to year of admission – Brazil (2009–2019)

Year of admission	Total with disability	Males (M)	Females (F)	Sex ratio (M/F)	Total without disability	Males (M)	Females (F)	Sex ratio (M/F)
2009	7,300	3,573	3,727	95.9	1,938,766	857,772	1,080,994	79.4
2010	7,382	3,921	3,461	113.3	2,167,033	954,462	1,212,571	78.7
2011	7,525	3,889	3,636	107.0	2,329,421	1,029,119	1,300,302	79.1
2012	10,150	5,171	4,979	103.9	2,726,491	1,194,949	1,531,542	78.0
2013	10,181	5,259	4,922	106.8	2,719,094	1,192,626	1,526,468	78.1
2014	10,349	5,384	4,965	108.4	3,080,209	1,353,662	1,726,547	78.4
2015	11,307	5,885	5,422	108.5	2,887,388	1,291,443	1,595,945	80.9
2016	11,755	6,083	5,672	107.2	2,942,695	1,308,421	1,634,274	80.1
2017	13,459	7,175	6,284	114.2	3,182,759	1,419,846	1,762,913	80.5
2018	16,861	8,882	7,979	111.3	3,398,944	1,487,522	1,911,422	77.8
2019	17,167	8,991	8,176	110.0	3,585,986	1,535,943	2,050,043	74.9

Source: Authors' own calculations with data from the Higher Education Census (INEP, 2009 to 2019)

Regarding the evolution of the average age of the new admissions, male students, as a rule, were older than female students, and those with disabilities, older than those without disabilities in about two years (see Table 3). The trajectories of the average ages were increasing in all combinations of sex and disability, indicating the inclusion of an older contingent in Higher Education, with an acceleration from 2016 on.

Table 3 - Mean age (in years) of students with and without disabilities in Higher Education, by year – Brazil (2009–2019)

Disability condition and sex	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019
Without disability											
Male	26	26.1	26.1	26.1	26	26.3	26.1	26.2	26.6	27	27.3
Female	25.9	26	26	25.9	25.7	26	25.9	26	26.3	27	27.4
With disability

Female	27.1	28.2	28.2	27.5	27.4	28.2	28.8	28.4	28.6	29.1	29.3

Source: Authors' own calculations with data from the Higher Education Census (INEP, 2009 to 2019)

Regarding the type of disability declared during the period, the largest number of students with disability were those with physical disabilities, followed by those with vision impairment, both increasing in time (see Table 4 and Table 5). New admissions with hard of hearing students had a stable trajectory and came in third place from 2012 on.

Table 4 - Students with disabilities in Higher Education, by type of disability, according to year of admission – Brazil (2009–2019)

Year of admission	Blind	Vision impairment	Deaf	Hard of hearing	Deaf/blind	Physical disability	Multiple disability	Intellectual/mental disability	Total
2009	1,059	2,051	574	2,065	37	1,356	114	144	7,400

The evolution of young people with disabilities in tertiary Education showed that there was a discontinuity in the 2011/12 and 2017/18 intervals and that the quota more than doubled between 2009 and 2019, as already mentioned, an average growth rate of 9.0% p.y. Students with physical disabilities not only constituted the largest contingent, but also those with the second highest average growth rate in the period: 16.2% p.y. The highest growth rate occurred in the contingent of intellectual/mental disability (30.1%), but because the starting point was small: 144 students.

The distribution of students with disability by December of each calendar year (see Table 7), showed that, relatively, a higher proportion of incoming without disabilities (see Table 6) appeared in the categories *dropout* and *leave of absence*. On the other hand, the proportion of those with disabilities was higher among those who continued the course at the end of the year (*enrolled*). The other categories were residual at the end of the year of admission. In more recent years, there is a higher proportion of students who are on *leave of absence* and a lower proportion of students *enrolled* in the course both among those with disabilities and those without disabilities.

The evolution of the proportion of new admissions by admission criteria (quotas by race, disability, social) considering disability (see Table 8), pointed out that the proportion of students with disability was consistently higher, and the difference increased over time. The proportion increased among students with disability, reaching 23.4% in 2018, and was reasonably stable among students without disabilities, reaching a maximum of 5.1% in 2016.

Table 8 - Students with and without disability by admission criteria, according to the year of admission – Brazil (2009–2019)

Year of admission	Students without disability				Students with disability

The evolution of the proportion of students with scholarship/financing, according to the disability condition (see Table 9), revealed a situation different from that observed in the quota situation: students with disability presented lower proportion receiving scholarship/financing in all the years of the period. However, the difference between the proportions of new admissions with and without disability was not significant, and the growth trend was observed in both groups.

Table 9 - Admissions of students with and without disability by scholarship/funding, according to the year of admission – Brazil (2009–2019)

Source: Authors' own calculations with data from the Higher Education Census (INEP, 2009 to 2019)

The evolution of the proportion of admissions of new students with disabilities, according to the institution's administrative category (see Table 10), revealed that the proportion of these students in public institutions was higher than the proportion of them in private ones, and the difference between these two proportions increased over time, possibly due to Law n° 13,409 of 2016 (BRASIL, 2016), which guaranteed quotas for people with disability in federal institutions. In other words, the proportion of new admissions in public institutions increased among students with disability and was rather stable in private institutions, which points to a more frequent choice of these students by public institutions, which may help explain the lower proportion of scholarship/funding found among them.

Table 10 - Students with disability in Higher Education (total %) by administrative category, according to the year of admission – Brazil (2009–2019)

The evolution of the proportion of students with disability, according to the type of institutions's academic organization (see Table 11), showed that the only proportions that seemed stagnant between 2009 and 2019 were those of *Faculdades*. The others presented increasing values in the period, but the proportion of students with disabilities appeared with greater strength in *Instituto Federal de Educação, Ciência e Tecnologia*.

*see footnote 12 for the categories considered.

Considering the evolution of the proportion of students with disability, according to tertiary Education degree (see Table 12), the values of bachelor's degrees of Education and others bachelor's degrees showed increasing trends. The proportion in short-cycle courses was basically stable in the most recent period.

Table 12 - Students with disability in Higher Education (total %) by tertiary Education degree, according to the year of admission – Brazil (2009–2019)

Year of admission	Tertiary Education Degree		
	Others bachelor's degrees	Bachelor's degrees in education	Short-cycle tertiary education

Considering the teaching mode (see Table 13), it was possible to notice that the proportion of students with disability in face-to-face courses showed an increasing trend, while the proportion of those who entered distance courses

seemed reasonably constant. However, it should be considered that the growth rate of students in distance learning courses was much higher than the rate of admissions in conventional courses.

Table 13 - Students with disability in Higher Education (total %) by teaching mode, according to the year of admission – Brazil (2009–2019)

The evolution of the proportion of students with disability, according to the assistive technologies offered by the course (see Table 14), revealed that the proportion of courses without these technologies was more erratic, possibly due to the smaller number in this situation. Both proportions appear to be growing over time. As it will be seen below, the offer of assistive technologies for the courses has been increasing over time.

Table 14 - Students with disability in Higher Education (total %) by course assistive technologies, according to year of admission – Brazil (2009–2019)

The evolution of the proportion of admissions with Access in to the different types of assistive technologies offered by the course showed that the proportion has been increasing for all types (see Table 15), but the discipline of Libras was the most frequently offered. The only drop was in the proportion of institutions without any of the conditions: values fell from 29.1% to 3.2%.

The evolution of the proportion of students with disability, according to Access in to different types of assistive technologies (see Table 16), showed that increasing proportions would imply a trend of reference for that type of Access inibility condition. It is difficult to discern the types with increasing trends, but these were: *provides sign translator and interpreter*, *Access inible computer resources*, *material with enlarged characters* and *subject of sign language*.

Source: Authors' own calculations with data from the Higher Education Census (INEP, 2009 to 2019)

The evolution of the proportion of students with disability in relation to the total number of new admissions, according to degree and major of the course, showed that the total presented an increasing trend (see Table 17). Some areas stood out in certain periods: Business Administration & Management (2 years), between 2012 and 2017; and Law (undergraduate) between 2011 and 2013.

Table 17 - Admission in Higher Education (total %) by year according to degree and major – Brazil (2009–2019)

Source: Authors' own calculations with data from the Higher Education Census (INEP, 2009 to 2019)

The proportion of students with disability in selected areas in relation to the total number of students with disability in Higher Education, by year of admission, showed that the highest allocation of students with disability was in the area of Administration and Management and in the area of Law (undergraduate). But as it can be seen from the previous table, these were also the preferred areas of choice of the students in general, even if they show a fall in the last years of the period, as shown in Table 18.

5 Final considerations

The analysis of the characteristics of students with different disabilities who entered tertiary Education between 2009 and 2019 showed that the contingent more than doubled, with an average growth rate of 9.0% p.y. It is still a small proportion of the number of students, though, ranging from 0.3% to 0.5%. This growth trend shows that the inclusion process, at this level of Education, is at the incept, even if supported by the Brazilian legal apparatus that has walked *pari passu* with international conventions and agreements.

Students with disability showed a different set of characteristics than that of the other students' with respect to gender, average age and choice of course/area. The guarantee of Access inibility conditions (offering some type of assistive technology and/or technical help), obviously, seems to attract more students with disability to courses/institutions.

Inclusão de estudantes com deficiência no Ensino Superior brasileiro

Resumo

Em 2016, o Brasil aprovou a Lei nº 13.409, determinando cotas para indivíduos com deficiência nos cursos técnicos de níveis médio e superior das instituições federais de Ensino. Desde 1995, o Instituto Nacional de Estudos e Pesquisas Educacionais/Ministério da Educação (Inep/MEC) coleta dados sobre cursos universitários e matrículas de alunos através do Censo da Educação Superior. A partir de 2009, esse censo lista e identifica individualmente todos os alunos matriculados nos cursos superiores por um código gerado pelo Inep, levantando diversas informações, entre elas, se possuem alguma deficiência. Poucos estudos sobre estudantes com deficiência no Ensino Superior têm sido realizados explorando essa extensa base de dados. O presente estudo traça um perfil dos alunos sem deficiência que ingressaram no sistema de 2009 a 2019, último ano em que foi possível obter a informação. Por causa da Lei Geral de Proteção de dados, o Inep descontinuou a publicação dos microdados por aluno, o que permitia as tabulações aqui apresentadas. Não apenas isso foi feito, como também foram retirados da página os microdados utilizados nesse texto. Estudantes com deficiência apresentaram perfil diferente dos demais estudantes, por exemplo, com relação à distribuição por sexo, idade média, escolha de curso/área. Obviamente, instituições que ofereciam algum tipo de tecnologia assistiva e outras condições de acessibilidade se mostraram mais atrativas para eles. O maior número de estudantes com deficiência declaram deficiência física, seguido de baixa visão, ambos os grupos têm aumentando com o tempo. O contingente total de estudantes com deficiência mais que dobrou no período, com taxa média de crescimento de 9,0% a.a. embora seu percentual no ensino superior ainda seja bastante reduzido em relação ao total de alunos. A tendência de crescimento no período mostra que o processo de inclusão no Ensino Superior ainda está começando.

Inclusión de estudiantes con discapacidad en la Educación Superior

Resumen

En 2016, Brasil aprobó la Ley nº 13.409, que determina cuotas para personas con discapacidad en cursos técnicos de nivel medio y superior en instituciones educativas federales. Desde 1995, el Instituto Nacional de Estudios y Encuestas Educativas/Ministerio de la Educación (Inep/MEC) recopila datos sobre cursos universitarios y matrícula de estudiantes a través del Censo de Educación Superior. A partir de 2009, este censo enumera e identifica con un código individual generado por el Inep a todos los estudiantes matriculados en cursos de educación superior; recopilando información diversa, incluida si tienen una discapacidad. Se han realizado pocos estudios sobre estudiantes con discapacidad en la Educación Superior utilizando esta extensa base de datos.

El presente estudio describe un perfil de los estudiantes con discapacidad que ingresaron al sistema de 2009 a 2019, último año en el que fue posible obtener información. Debido a la Ley General de Protección de Datos brasileña, el Inep suspendió la publicación de microdatos por alumno, lo que permitía las tabulaciones aquí presentadas. No solo se hizo esto, sino que también se eliminaron de la página los microdatos utilizados en este texto. Los estudiantes con discapacidad tenían un perfil diferente al de otros estudiantes, por ejemplo, en términos de distribución por género, media de edad, elección de curso/área y. Obviamente, las instituciones que ofrecían algún tipo de tecnología asistiva y otras condiciones de accesibilidad les resultaban más atractivas. El mayor número de estudiantes con discapacidad declara discapacidad física, seguido de baja visión. Ambos grupos han ido aumentando con el tiempo. El contingente total de estudiantes con discapacidad ha más que duplicado en el período, con una tasa media de crecimiento de 9,0% anual. Aunque su porcentaje en la Educación Superior es aún bastante reducido en relación al total de estudiantes. La tendencia de crecimiento en el período muestra que el proceso de inclusión en la Educación Superior aún se está iniciando.

Palabras clave: Educación Superior. Datos Estadísticos. Persona con Discapacidad. Educación Inclusiva.
